Re: ZumSil (Monosilicic acid 20%)

In our attempt to assist our producers with ensuring our products can be used in Organic Production Systems, we have sought verification documents for ZumSil (Monosilicic Acid 20%) from Eco Cert Canada.

EcoCert has evaluated the ZumSil product and in response to this evaluation, they have determined that this product can be used in Organic production systems but with the following restrictions.

“ To be used when soil and plant deficiencies in silicon are documented by visual symptoms or by testing of soil and/or plant tissue, or when the need for a preventative application can be documented.”

As Silica is not a widely used input and relatively new to the industry, we have produced a document that outlines the many uses and effects of Silicia on plant and soil health. Please review the following uses for Silica and include this document with your input records.

If you have any questions or require copies of the research documents, please contact us at the office at 306 -747- 4744.

As always, please ensure your certifier is aware of inputs that you are using and have their approval.

Regards,

Cindy Nikolaisen, President
